

AP[®] Physics-1

The Mississippi School for Mathematics & Science

INSTRUCTOR: Jed Leggett, Office: Hooper Science 202
Email: jleggett@themsms.org
Phone: 662-329-7360,
Office hours: M.W.F: 8:00-9:00am, 2:00-3:00 pm; T: 1:00-2:30pm; Th: 8:00-9:30 am

TEXTBOOKS: OpenStax College, *College Physics*. OpenStax College. 21 June 2012.
Enrichment Text: Hewitt, *Conceptual Physics 9ed*, Pearson, 2001.

DESCRIPTION: AP[®]Physics-1 is an algebra and trigonometry based course which provides a college-level introduction to the principles of Newtonian mechanics including kinematics, work, energy, power, mechanical waves and sound, and also an introduction to circuits. Critical thinking and reasoning skills are developed through inquiry-based laboratory experiences. The lab-based course is designed to prepare students to take the AP[®] Physics-1 examination, which is administered each May. In order to foster critical thinking skills necessary to pursue a career in science or engineering, the course includes two separate hands-on components (Labs and Extended Design Projects) which utilize guided inquiry and student-centered, team-based design of experiments, presentation of design, results, and scientific argumentation. The class will meet for lecture on Monday, Wednesday & Fridays for one hour each day, and the lab will meet on Tuesdays or Thursdays for 1.5 hours each week. (Lab time constitutes 33% of the total in-class contact hours for the course.)

PREREQUISITE: none

COREQUISITE: Trigonometry or Foundations of Math

GRADING SCALE: A: 90 – 100 B: 80 – 89 C: 70 – 79 NC: 0 – 69

CHRONOLOGY

Week 1: Kinematics - Motion in One Dimension

Week 2-4: Kinematics - Motion in Two Dimensions

Weeks 5-7: Newton's Laws of Motion

Weeks 8-11: Work, Kinetic Energy & Potential Energy

Weeks 12: Power

Weeks 13-16: Systems of Particles, Linear Momentum & Collisions

Weeks 17-18: Static Equilibrium

Weeks 19-21: Circular Motion & Rotation

Weeks 22-25: Oscillatory Motion, Rotational Dynamics, Angular Velocity, Acceleration & Momentum, Conservation of Angular Momentum

Weeks: 26-27: Gravitation and Planetary Motion

Weeks: 28-31: Vibrations and Waves

Weeks: 32-34: Materials and Sound

Weeks: 35-36: Direct Current Circuits

ASSESSMENT

Homework / Class-Work: Homework will consist of reading, taking notes, answering conceptual questions and working problems. "Problem Sets" will be assigned from each chapter. Both the teacher and students will model many of these problems in class. In addition to lecture, class-work also will include "whiteboard problem solving" where each table is given its own 3'x4' whiteboard and one marker. When needed the teacher can offer suggestions, but the student teams must communicate effectively as a team and bring all their problem solving skills to bear upon the problem at hand. When completed, the team will present their solution before the classroom. The homework & class-work average will count 20% of the nine-weeks grade.

Quizzes: In order to reinforce the reading assignments, one out-of-class, computer-based "Conceptual Quiz" per unit will be averaged into the homework grade. The student may work the "Conceptual Quiz" as many times as he or she likes in order to score a higher score.

Labs: In order to foster critical thinking skills necessary to pursue a career in science or engineering, students will complete a hands-on lab component which utilizes guided inquiry and student-centered, team-based design of experiments. Lab grades will consist primarily of an inquiry-based design of experiment, followed by a collection of data and writing up the methods, results and conclusions in a professionally acceptable format. By the semester's end, the student will have generated a portfolio of experimental designs and lab write-ups. The lab average will count 20% of the nine-weeks grade. At least twenty or more of the following investigations (labs) will be performed during the year:

1. String-racer Acceleration
2. Mathematical Modeling of Free Fall with Video Analysis
3. Carts & Pulleys with Newton's 2nd Law
4. Work and Power of a Potato Launcher
5. Projectile Wars
6. Mine Field Vector Mapping and Vector Addition
7. Oil Platform Stability at Sea and Vector Addition
8. Hooke's Law and Conservation of Energy in an Oscillating Spring
9. Work Done by Friction to Stop a Projectile, Conservation Laws
10. 1D collisions Momentum, Recoil & Conservation Laws
11. 2D collisions, Impulse, Elastic & Inelastic Collisions
12. Simple Pendulum
13. Ballistic Pendulum
14. Rotational Inertia
15. Physical Pendulum
16. Center of Mass of Flat Disks of Varying Shapes
17. Standing Waves on a String
18. Speed of Sound in Air
19. Resonance Tubes and Speed of Mechanical Waves in a Fluid
20. Resistance & Resistivity in Simple Circuits
21. Electric Switches, 2-way, 3-way & 4-way
22. Experimental Procedure & Identification of Systematic Variances

Projects: In order to foster critical thinking skills necessary to pursue a career in science or engineering, students will complete team-based engineering design units which utilize guided inquiry and student-centered, team-based engineering design projects. These extended engineering design projects will require the student teams to bring all their physics knowledge to bear upon a problem of engineering design and also may incorporate the use of numerical methods, statistical methods and computer programming in order to complete the team-based designs. Two extended "Engineering Design" projects will be assigned during the school year leading to team-based PowerPoint presentations of engineering designs and classroom-collaborative scientific argumentation and critique of engineering designs. The Projects will be averaged into the lab average. At least two of the following design projects will be performed during the year:

1. Optimization Design of Catapult: Statistical Design of Experiment
2. Optimization Design of a Trebuchet: Statistical Design of Experiment
3. Optimization Design of Rocket: Propulsion
4. Electrical DC Circuit Application Design
5. Other

Unit Tests: There will be 2 – 4 tests each nine-weeks. These tests will cover the material assigned for study on the particular topics. The average of these tests will count 60% of the nine-weeks grade. Missed unit tests will be made up no later than 5 days after the test is given.

Semester Exam: The semester exam shall count 20% of the semester grade. Each nine-weeks grade shall count 40% of the semester grade.

Academic Dishonesty. The Physics Department defines academic dishonesty to be any action in which a student claims any work done by another person or machine as his or her own work. Some examples of academic dishonesty are as follows:

- Copying another person's homework, lab report, etc.
- Putting a student's name on a project in which that student has not done an equal part
- Reporting on an assignment that has not been read, such as a book report, extra-credit reading etc.
- Using unauthorized notes or another person's work on tests
- Discussing material on test with others who have not yet taken the test
 - Plagiarism

Honor Code. In this course, anything the student turns in for a grade must be “pledged” according to the following honor code:

“I promise that I have neither given nor received any unauthorized help on this assignment.”

Simply writing “**I promise**” near your name will serve as shorthand for the full pledge. To clear up any confusion, note that any help at all on a test is unauthorized. On homework and labs, students are urged to give and receive help from others and to work in small groups in order to learn, as long as copying is not the result. Help each other and compare answers on homework and other assignments done outside of class. Discuss those answers on which you disagree, changing your answer if you choose. The goal is for you to become an independent learner, capable of group interaction. However, after receiving help on a problem outside of class from another student, keep in mind that if you have the answer but do not understand how to get it yourself, then you have been helped to cheat and not to learn.
